Numerical Model Forecast
Motivation

Air Pollution

Mathematical models: Data assimilation, particle filters (non-linear particle filters).
Motivation

Mathematical models

Motivation

Mathematical models

- Sensitivity.
- Uncertainty sources.

To identify, measure, and model significant sources of uncertainty in the short-term meteorological forecast with the Weather Research and Forecasting (WRF) numerical model and to develop a methodology based on non-linear particle filters for reducing it.
The WRF model: numerical weather prediction and atmospheric simulation system.

The WRF model is used for studying the air quality.

\[ \partial_t U + m_x [\partial_x (U_u) + \cdots] = F_U, \]
\[ \partial_t V + m_y [\partial_x (U_v) + \cdots] = F_V, \]
\[ \partial_t W + \left( \frac{m_x m_y}{m_y} \right) [\partial_x (Uw) + \cdots] = F_W. \]
Some Problems

- How does accurate solution close to reality?
- How does change the solution of the system when we change these conditions?
- How sensitive is the model for the small changes made to it?
- What is the maximum change in the conditions such that there is no change in the solution?
Sensitivity Analysis (SA)

- The uncertainty (variability) associated with a sensitive parameter in the model.
The sensitivity analysis tries to respond questions in relation to how the variation in the output can associate with variations in the different input factors.

The sensitivity analysis is a function between the model inputs and the model outputs.

The uncertainty analysis discriminate the quantify of uncertainty in the output of a model and it is used for uncertainty assessment of numerical models.

(Uusitalo et al. 2015, Pianosi et al. 2016).
Uncertainty Analysis and Quantification

The uncertainty quantification is the science of quantitative characterization and reduction of uncertainties in both computational and real-world applications. It tries to determine how likely certain outcomes are if some aspects of the system are not exactly known.
Uncertainty, in models of physical systems, is almost always represented as a probability density function (PDF) through samples, parameters, or kernels (objective of uncertainty quantification).
1. Define the system of interest, its response, and the desired performance measures.

2. Write a mathematical formulation of the system-governing equations, geometry, and parameter values.
Uncertainty Analysis and Quantification: Steps

3. Formulate a discretized representation and the numerical methods and algorithms for its solution.
4. Perform the simulations and the analysis.
5. Loop back to step 1.
Solution Tools

Uncertainty Quantification

⇓

Data Assimilation
Solution Tools

- Uncertainty Quantification

Data Assimilation

1. Data Assimilation.
2. Particle Filters.
Tool: Data Assimilation

- It is an approach/method for combining observations with model output with the objective of improving the latter.
- Data assimilation combines past knowledge of a system in the form of a numerical model with new information about that system in the form of observations of that system.

(van Leeuwen et al. 2015, Asch et al. 2016).
Data Assimilation: Methods

(Asch et al. 2016).

Jhon E. Hinestroza R. (Doctoral Seminary 1)  Atmospheric Dynamics  October 19, 2018  19 / 38
The particle filters can be used to estimate the state of a system. To estimate $x$, using $y$.

The aim: To approximate the relevant probability distributions, with discrete aleatory measures (or continuous) called particles and his weight associates.

(Quintero 2010).
Filtering Problem

Observations $\{Y_t\}$ $\implies$ Predictions of State $\{X_t\}$
Observations \( \{ Y_t \} \) \(\implies\) Predictions of State \( \{ X_t \} \)

**State \( X \)**

\[
\frac{X_t}{dt} = b(t, X_t) + \sigma(t, X_t)W_t; \quad t \geq 0,
\]

where \( b : \mathbb{R}^{n+1} \to \mathbb{R}^n \), \( \sigma : \mathbb{R}^{n+1} \to \mathbb{R}^{n \times p} \), and \( W_t \) is \( p \)-dimensional white noise.
Observations \( \{ Y_t \} \implies \) Predictions of State \( \{ X_t \} \)

**State \( X \)**

\[
\frac{X_t}{dt} = b(t, X_t) + \sigma(t, X_t) W_t; \quad t \geq 0,
\]

where \( b : \mathbb{R}^{n+1} \to \mathbb{R}^n \), \( \sigma : \mathbb{R}^{n+1} \to \mathbb{R}^{n \times p} \), and \( W_t \) is \( p \)-dimensional white noise.

**Remark:** The aim in a filtering problem: To determine the conditional distribution of \( X \) using \( Y \).
Foundation of the Problem

\[ p(x|y) = \frac{p(y|x) \cdot p(x)}{p(y)} \]
How to Approximate the States of the System?

Particle Filters

- The state equations are linear and its PDF "a posteriori" is Gaussian → Kalman filter.
- The state equations are non-linear and its PDF "a posteriori" is Gaussian → Extended Kalman Filter (EKF).
- If the state equations are too much non-linear and its PDF "a posteriori" is no-Gaussian → the EKF is not a good solution.
How to Approximate the States of the System?

- Particle Filters

- The state equations are linear and its PDF “a posteriori” is Gaussian → Kalman filter.
How to Approximate the States of the System?

Particle Filters

- The state equations are non-linear and its PDF “a posteriori” is Gaussian $\rightarrow$ Extended Kalman Filter (EKF).
How to Approximate the States of the System?

- Particle Filters

If the state equations are too much non-linear and its PDF "a posteriori" is no-Gaussian → the EKF is not a good solution.
How to Approximate the States of the System?

Non-linear Particle Filters

With a non-linear particle filters is seeked an equation for the conditional PDF of a process unobserved for a trajectory looked → Kushner and Zakai equation.
Particle Filters

With a non-linear and no-Gaussian filter the PDF and non-linear functions are approximated to find the solution.

(van Leeuwen et al. 2015).
Particle Filters

- The Gaussian Sum Filter (GSM).
- The Gibbs sampler.
- The Numerical Integration Filter (NIF).
- Montecarlo integration with importance sampling.
- Rejection Sampling Filter (RSF).

(van Leeuwen et al. 2015).
Non-linear Particle Filters

\[
\text{Non-linear Particle Filters} \Downarrow \quad \text{Approximate Solutions} \leftrightarrow \text{Importance Function}
\]
Ressampling

(Djuric et al. 2003).
Description of the Particle Filtering

(Djuric et al. 2003).

Jhon E. Hinestroza R. (Doctoral Seminary 1)  Atmospheric Dynamics
October 19, 2018  28 / 38
Some questions appear:

- What initial importance function to use for finding the solution?
- How the solution change with the an initial importance function selected?
- How much the solution change with an initial importance function selected?
- Is there sensitivity of the solution to the initial importance function selected?
Learning about WRF:

Taken from:
Learning about data assimilation.
Goals

- How does accurate solution close to reality?
- How does change the solution of the system when we change these conditions?
- How sensitive is the model for the small changes made to it?
- What is the maximum change in the conditions such that there is no change in the solution?
Expected Results

- To understand the sensitivity of the WRF model in the Aburrá Valley.
- To identify and reduce its uncertain sources, such that can obtain better results in the monitor of the climate and weather forecast.
Expected Results

- The results will must show the implications of the sensitivity of the model for the air quality modeling in the Aburrá Valley.
- This study will must show the importance of the non-linear data assimilation to forecasting weather modeling.
Thanks!
